# ABSTRACT

Systems and methods are described herein for remote management of printing devices of various types within an enterprise. Printers that are not as well-equipped for printing device management (e.g. legacy printing devices and low-end printing devices) are taken into account by assigning printing device management elements and functions that are present in more modern higher-end printing devices to one or more host computers. As a result, printing device management tasks can be similarly applied to all types of enterprise printing devices without having to use multiple user interfaces or user processes.
